

Daily Learning Report – Python + DSA Journey

Date: 29 June 2026

Objective

To strengthen my Python fundamentals before diving deeper into Data Structures and Algorithms (DSA), while building a consistent coding habit through structured learning and regular problem solving.

Learning Resource

YouTube: <https://youtu.be/IhG3UJzkjnw?si=cuYk2UqwYXPIPgTu>

Progress Made Today

- Completed approximately **20–25 minutes** of the lecture.
- Followed the instructor's explanation carefully instead of skipping ahead.
- Revised previously learned Python concepts while understanding how they are used in DSA.
- Focused on understanding the logic behind the code rather than simply memorizing the syntax.

Python Topics Completed So Far

Before starting this DSA lecture, I had already completed the following Python topics:

- Python Basics
- Variables and Data Types
- Input and Output
- Operators
- Conditional Statements (`if`, `elif`, `else`)
- Loops (`for` and `while`)
- `break`, `continue`, and `pass`
- Functions
- Function Parameters and Return Values

- Variable Scope
- Strings
- String Methods
- Lists
- List Operations and Methods
- Tuples
- Sets
- Dictionaries
- Dictionary Operations and Methods
- Basic Problem Solving using Python

These topics provide the foundation required to start learning Data Structures and Algorithms efficiently.

Concepts Learned Today

During today's lecture, I learned and revised:

- The importance of having strong Python fundamentals before starting DSA.
- The correct approach to understanding coding problems.
- Breaking a problem into smaller logical steps.
- Reading and analysing inputs before writing code.
- Thinking about multiple possible solutions before implementation.
- Dry-running programs to verify logic and identify mistakes.
- Writing clean, readable, and maintainable Python code.

Key Takeaways

- Logic-building is more important than memorizing code.
- Understanding why a solution works is essential for solving new problems.
- Consistent daily practice is the key to becoming better at programming.
- Python syntax should become second nature before moving to advanced DSA topics.

Practice Plan

- Complete the remaining portion of the lecture.
- Revise today's concepts.
- Solve 2–3 beginner-level LeetCode problems using Python.
- Continue maintaining daily learning logs on GitHub to track progress.

Time Invested

20–25 minutes

Next Learning Goal

- Finish the remaining lecture.
- Begin solving beginner array-based problems on LeetCode.
- Continue strengthening Python while gradually transitioning into core Data Structures and Algorithms.

Status

Python Fundamentals Completed

DSA Journey Started

Continuing with structured learning and consistent coding practice.
